These foundational topics set the stage for understanding how electric charges influence their surroundings, which is crucial for both theoretical understanding and practical applications.

2. Electric Flux Density and Electric Displacement

Sadiku introduces the concepts of electric flux density ($\mathbf{D}$) and electric displacement, highlighting their roles in media with dielectric properties. This section emphasizes the importance of material properties in electric field analysis.

3. Poisson's and Laplace's Equations

The book delves into potential theory, deriving Poisson's and Laplace's equations, and discusses boundary conditions. These equations form the mathematical backbone of electrostatics problems involving complex geometries.

4. Magnetostatics

Transitioning to magnetic fields, Sadiku discusses:

- Biot-Savart Law
- Magnetic flux density ($\mathbf{B}$)
- Magnetic field intensity ($\mathbf{H}$)
- Magnetic forces and torque

- Magnetic materials and hysteresis effects

This segment helps students connect electric and magnetic phenomena, emphasizing their interrelation in static conditions.

5. Electromagnetic Induction

Faraday's Law and Lenz's Law are explored in detail, illustrating how time-varying magnetic fields induce electric currents. This is fundamental for understanding transformers, inductors, and generators.

6. Maxwell's Equations

A pivotal part of the book, Maxwell's equations are introduced as the comprehensive set governing electromagnetic phenomena:
