- Mechanical Properties and Behavior
- Thermal and Electrical Properties

- Materials Processing and Microstructure Development

Each of these domains forms an interconnected web of knowledge essential for predicting and tailoring material performance.

Atomic Structure and Bonding

The foundation of material behavior begins at the atomic level. Van Vlack emphasizes that the type of atomic bonding—ionic, covalent, metallic, or Van der Waals—dictates many of a material's properties, such as melting point, conductivity, and ductility.

- Ionic Bonds: Characterized by electrostatic attractions; common in ceramics like sodium chloride.
- Covalent Bonds: Sharing of electron pairs; seen in diamond and silicon.
