RouterOS Script Examples ? Unlocking the Power of Automated Network Management

In today's fast-paced digital landscape, network administrators and IT professionals seek efficient ways to manage and optimize their network infrastructure. MikroTik's RouterOS, renowned for its versatility and robustness, offers a powerful scripting language that enables automation, customization, and enhanced control over network devices. Whether you want to automate routine tasks, improve security, or monitor network performance, understanding RouterOS script examples can significantly streamline your workflow.

This article provides a comprehensive guide to RouterOS scripting, featuring practical examples and best practices. From basic scripts to advanced automation techniques, you'll learn how to harness the full potential of RouterOS scripting to create a more resilient, efficient, and manageable network.

Understanding RouterOS Scripting

RouterOS scripting language is a command-based language that allows administrators to automate tasks, configure devices, and respond to network events. Scripts can be executed manually, scheduled to run at specific times, or triggered by network events such as interface status changes.

Key features of RouterOS scripting include:

- Variable management
- Conditional statements (if-else)
- Loops (for, while)
- Event handling
- Integration with system functions (logging, sending emails, etc.)

Before diving into examples, ensure you have access to the MikroTik terminal or Winbox interface, and understand basic RouterOS commands.

Basic RouterOS Script Examples

1. Simple Backup Script

A fundamental task for network management is backing up configuration files regularly. Here's a simple script:

```
``plaintext

/system backup save name=backup-$(/system clock get time)

...

```

This script saves a backup named with the current time, aiding in version control.

2. Restarting a Interface Based on Traffic

Automate interface management with traffic monitoring:

```
``plaintext

:if ([/interface monitor-traffic ether1 once as-value]->"rx-rate") > 1000000 do={

/interface disable ether1

/delay 10s

/interface enable ether1

}

...

```

This script disables 'ether1' if traffic exceeds 1 Mbps, then re-enables it after 10 seconds.

3. Sending Email Alerts on High CPU Usage

Monitoring CPU load and alerting admins:

```
``plaintext

:local cpuUsage [/system resource get cpu-load]

:if ($cpuUsage > 80) do={

```

```
/tool e-mail send to="[email protected]" subject="High CPU Usage" body=("CPU load is at " .
$cpuUsage . "%")
```

```
}
```

```
...
```

Ensure email settings are configured beforehand.

Advanced RouterOS Script Examples

4. Dynamic Firewall Rules Based on IP Address

Automatically block an IP address after multiple failed login attempts:

```
``plaintext
```

```
:local ip "192.168.1.50"
```

```
:local maxAttempts 3
```

```
:local attempts [/tool user-manager active-user find where=common-ip=$ip]
```

```
:if ($attempts > $maxAttempts) do={
```

```
/ip firewall filter add chain=input src-address=$ip action=drop comment="Blocked after failed
attempts"
```

```
}
```

```
...
```

This script can be integrated with login failure logs.

5. Automated VPN Connection Management

Ensure VPN connection remains active:

```
``plaintext
```

```
:if ([/interface l2tp-server get [find name="L2TP-VPN"] running]) = false do={
```

```
/interface l2tp-client connect name=L2TP-VPN user=youruser password=yourpass  
}
```

```
...
```

Schedule this script periodically to maintain VPN connectivity.

6. Network Monitoring and Logging

Track bandwidth usage and log:

```
``plaintext  
  
:local totalRx [/interface monitor-traffic ether1 once as-value]->"rx-byte"]  
  
:local totalTx [/interface monitor-traffic ether1 once as-value]->"tx-byte"]  
  
/log info message=("Ether1 Traffic - RX: " . $totalRx . " bytes, TX: " . $totalTx . " bytes")  
  
...
```

Set up scripts to run at intervals for continuous monitoring.

Best Practices for Writing RouterOS Scripts

- Comment Your Scripts: Use comments (``) extensively to explain logic, making maintenance easier.
- Test Scripts in a Lab Environment: Before deploying on production, test scripts to avoid unintended disruptions.
- Use Variables Wisely: Store values in variables for readability and reusability.
- Schedule Scripts Carefully: Use `/system scheduler`` to automate tasks during off-peak hours.
- Handle Errors Gracefully: Incorporate error checking to prevent scripts from failing silently.

Scheduling and Automating Scripts

RouterOS provides a scheduler to run scripts automatically:

```
``plaintext
```

```
/system scheduler add name="Daily Backup" start-date=jan/01/2024 start-time=02:00:00  
interval=24h on-event="/system backup save name=backup-$(/system clock get time)"
```

...

This schedules daily backups at 2 AM.

Conclusion

RouterOS scripting opens up a world of automation, enabling network administrators to reduce manual effort, improve security, and optimize performance. By mastering script examples from basic backups to complex event-driven actions, you can tailor your MikroTik devices to meet your specific needs.

Remember, the key to effective scripting is continuous learning and experimentation. With the myriad of possibilities available, well-crafted scripts can significantly enhance your network's resilience and efficiency.

Harness the full potential of RouterOS scripting today and transform your network management approach into a seamless, automated process.

/system scheduler add name=dailyTrafficReport schedule=0 0 interval=1d
on-event=dailyTrafficReport

...
```

Explanation:

- Collects and logs traffic data daily.
- Demonstrates scheduled execution.

## Complex Use Cases and Best Practices

While simple scripts are useful, complex network environments benefit from sophisticated scripting.

### 1. Handling Errors Gracefully

Always include error handling to prevent scripts from failing silently.

```
:local result [/ip address add address=192.168.1.1/24 interface=ether1]

:if ($result = "") do={

:log error "Failed to add IP address."

}

...
```

2. Using External Data Sources

Scripts can fetch data via HTTP or fetch commands, enabling integration with APIs or external databases.

```
```plaintext

/tool fetch url="http://api.example.com/get-config" mode=https dst-path=config.json

Parse JSON if needed (requires additional scripting or external tools)

...
```

## 3. Modular Scripting

Break scripts into functions for reusability.

```
```plaintext

:global addFirewallRule do={

}

...
```

Invoke with `addFirewallRule`.

Security Considerations When Using Scripts

- Always validate and sanitize external data sources.
- Protect scripts containing sensitive information.
- Limit script execution permissions.
- Regularly review and update scripts to patch vulnerabilities.
